

The `HTMLMediaElement.src` property reflects the value of the HTML media element's `src` attribute, which indicates the URL of a media resource to use in the element.

Note: The best way to know the URL of the media resource currently in active use in this element is to look at the value of the `currentSrc` attribute, which also takes into account selection of a best or preferred media resource from a list provided in an `HTMLSourceElement` (which represents a `<source>` element).

Syntax

```
var mediaUrl = HTMLMediaElement.src;
```

Value

A `USVString` object containing the URL of a media resource to use in the element; this property reflects the value of the HTML element's `src` attribute.

Example

```
var obj = document.createElement('video');  
console.log(obj.src); // ""
```
